Giving your projects a memory.

Work on a project for a few weeks and the reasons behind it fade. Why you chose this over that. What you already tried. What is still open. Adjutant writes that down for you while you work, and hands it back when you return.

YOU NEED

- ✓ **Claude Code**, signed in claude.com ↗
- ✓ **Obsidian**, free. You read the vault in it. obsidian.md ↗
- ✓ a **Mac** or a **Windows** PC
- ✓ **Python**. Setup checks it for you.
- ✓ about **ten minutes**, once

ON THIS PAGE

- 01 A vault is your project's memory
- 02 Adjutant keeps it current
- 03 The words, in plain English
- 04 Set it up
- 05 The five verbs
- 06 The board
- 07 If something looks wrong

You do not need a terminal

Claude Code comes in more than one shape. A desktop app for Mac and for Windows, a command in a terminal, a tab in your browser, and an extension inside editors such as VS Code. Adjudant works the same in all of them. The desktop app is the gentlest place to start, and nothing in this guide needs a terminal.

A vault is your project's memory.

A vault is a folder of plain text files. Obsidian reads it and shows you how the files link together. Nothing is locked in a database, and nothing needs a server.

The files stay readable without Obsidian. Open one in any text editor and it still makes sense. That matters in five years, when the tools have moved on.

A vault in Obsidian. Your projects run down the left, the note you are reading sits in the middle, and the panel on the right shows what links to what.

Adjutant keeps it current.

You do not write these notes. Adjutant writes them as you work, then keeps them in shape.

- **A session note per working day.** What you did, what you decided, what you committed. It appears on your first real change, so a day you only read leaves nothing behind.
- **A decision note when you settle something.** It records the choice and the reason. Later it records what replaced it.
- **A handoff, written at the end of a session.** Where you stopped, what comes next, and the context you would otherwise have to rebuild.
- **A board of your tasks.** It is built from your task notes. Drag a card and the note changes to match.

The screenshot displays the Claude Cabinet application interface. On the left, a vertical stack of dates from 2026-07-15 to 2026-08-13 is shown, with 2026-08-13 highlighted. Below the dates is a file explorer showing folders like 'tasks', 'tracks', and 'mudak'. The main central pane shows a session log for '2026-08-13' with a title 'Continue the 2026-08-12 marathon: T55 module-presentation probe follow-through — default-module hiding applied.' and a 'Log' section containing detailed notes about HubSpot modules and brand-coded module icon trials. On the right, a network diagram with colorful nodes and connecting lines is visible, along with a table of contents listing items like 'content', 'track', 'theme-studio', and 'nightly-shared' with their respective word counts. The bottom status bar indicates '0 backlinks', '5 properties', '629 words', and '4,448 characters'.

A session note. One per working day, written as you go. The days stack up on the left, so last month is still there when you need it.

The words, in plain English.

VAULT	A folder of notes for one or more projects. You read it in Obsidian.
PROJECT	One folder inside the vault. It holds everything about one piece of work.
SESSION NOTE	One note per working day. Adjudant writes it while you work.
DECISION	A note that records one choice and the reason for it.
HANDOFF	A short note that says where you stopped and what comes next.
BOARD	A kanban view of your task notes. It runs on your own machine.
VERB	One word after <code>/adjudant</code> . It tells adjudant what to do.
SLUG	The short name of a project, in lowercase with hyphens.

Set it up.

Run these once per project. Each step is one line in Claude Code.

1 Add the marketplace

Open Claude Code in your project. Type this and press return.

```
/plugin marketplace add TomVDH/furtive-follies
```

2

Install adjudant

```
/plugin install adjudant
```

Restart Claude Code when it asks. The plugin loads on the next start.

Link the project

```
/adjutant connect
```

Adjutant asks where the vault goes. Pick a cloud-sync folder, and your notes follow you between computers. Adjutant then makes the vault and links this project to it.

It asks you to confirm a few facts about the project. Answer them, and it writes the answers down.

```
knobs      cost_warn_tokens: 30000
           stale_after_days: 30
state      fresh, zone: active

Two fields need your call.

Planning: /Users/tomvanderhegden/.claude/plans/connect-temporal-otter.md

← Type Purpose ✓ Submit →

project_type inferred as `tinkerage` (empty dir, no signal). Confirm or correct?

> 1. tinkerage
   Scratch/experiment space. Vault scaffold: sessions/ only. Matches the 'shot-scratch' name and the
   empty directory.
  2. coding
   Real codebase. Scaffold: decisions/, notes/, tasks/, references/, sessions/, images/ plus base
   dashboards and kanban seeding.
  3. plugin
   Claude Code plugin. Coding scaffold plus releases/.
  4. knowledge
   Research/notes project. Scaffold: notes/, sources/, references/, sessions/.
  5. Type something.

6. Chat about this

Enter to select · Tab/Arrow keys to navigate · Esc to cancel
```

Adjutant walks you through the setup on `/adjutant connect`. It guesses, then asks you to confirm.

Open the vault in Obsidian

Adjutant made the folder. Obsidian does not know about it yet. Tell it once.

Right-click the vault name at the bottom left, then choose **Manage vaults**.

Right-click the vault name at the bottom left, then choose **Manage vaults**.

Choose **Open folder as vault**, then pick the folder that `connect` made for you.

5

Work

That is the whole setup. Adjutant writes as you go from here.

Come back after a break and run `/adjutant status`.

The five verbs.

One command drives everything. You type `/adjutant` and then one word.

VERB	WHAT IT DOES
<code>connect</code>	Links a project to a vault. You run it once per project.
<code>status</code>	Tells you where you are, what is wrong, and what is stale.
<code>clean</code>	Removes what the vault does not need.
<code>dream</code>	Reads your notes and reports what only judgement finds.
<code>board</code>	Runs a kanban board built from your task notes.

Start with status

It changes nothing. It reads the project and reports in three bands.

band 1	WRONG NOW	A note points at a file that is gone. A task sits open in an archive. Fix these first.
band 2	GOING STALE	Nobody has checked this page in three months. The handoff is older than the newest session.
band 3	WORTH A LOOK	Smaller things. Read them when you have time.

The bands run by the cost of being wrong. You can stop reading at any point.

Cleaning up

Two verbs clean, and they differ by risk.

<code>clean</code>	ROUTINE	Mechanical repairs. It creates no file in your vault.
<code>clean --deep</code>	SPARING	Structural findings, reported for you to judge.
<code>dream</code>	AS NEEDED	It reads the prose. You approve every change.
<code>clean</code>	takes a phase, and it changes nothing until you name the last one.	

<code>/adjudant clean detect</code>	lists what it found
<code>/adjudant clean preview</code>	writes the full proposal, outside your vault
<code>/adjudant clean apply</code>	makes the changes, after a backup

Read the preview before you apply

`clean apply` deletes index files that adjudant no longer keeps. That is correct, and it is also permanent. Run `preview` first and read it. Adjudant backs up every file it touches, outside your vault.

The board.

Your task notes are the board. Adjudant builds it from them and serves it on your own machine. Nothing leaves your computer.

```
/adjudant board
```

Drag a card to another column and adjudant writes the change back to the note. Edit the note instead, and the card moves on the next build. The notes stay the record.

The board, built from your task notes and served on your own machine. Drag a card between columns and adjutant saves the change back to the note.

If something looks wrong.

- **Ask Claude Code.** Describe what you see. It reads the same files you do, and it can usually explain the difference.
- **Run `/adjutant status`**. It reports what is wrong before it reports anything else.
- **Nothing is hidden.** Every note is a plain text file in your vault. Open it and read it. Edit it by hand if you want to.
- **Your notes are yours.** Adjutant writes into the vault and backs up outside it. Remove the plugin and every note stays where it is.

A word you did not choose

Adjudant names one rare word at the start of a session and asks for it at the end of every reply. It is a drift check. When the word stops appearing, the model has started to forget its instructions, and that is the moment to start a fresh session.
